The controlled copy of this document is found either in the project collaboration tool, within the Project Management Plan section, or other project specific database/server approved by the Regional EHS Manager / Head of EHS Integrated Project.

1. SCOPE OF PROJECT AND SUB PLAN

Project Details	
Scope of the Sub Plan	This Asbestos and Hazardous Building Material Management Sub Plan details control measures for works where asbestos and/or hazardous building materials are present or identified during construction. It defines mitigation measures to be implemented during relevant construction activities, a monitoring program that enables assessment of the impacts of construction activities on potentially affected areas, and contingency measures that may be implemented if exceedances are measured. Refer to Section 1.1 and 3.1 of the Project EHS Management Plan for clarification on how the EHS Sub Plans form part of the Lendlease Construction (LLC) EHS management system.
Objectives of the Sub Plan	 To provide a process for the identification of asbestos or hazardous building materials in site buildings or structures. To ensure the proper removal of any asbestos or hazardous building materials identified in site buildings or structures. To ensure that asbestos and hazardous building materials are properly stored, transported, and disposed of to an approved, licensed waste facility. To prevent any impact to air quality or site work areas and adjoining properties via inappropriate handling, removal, or disposal of asbestos or other hazardous building materials.
Scope of Works	 This Sub Plan has been prepared based on the following scope of works across all stages: Site establishment including vegetation removal, topsoil stripping, office, work zone, amenities, and compound setup. Demolition of Thomas & Rachel Moore education centre, Alex Grimson, Oncology and Pathology buildings. Excavation of approximately 10,000m3 of material and backfilling of approximately 4,00m3 of clean fill. Installation of bored and Continuous Flight Auguring (CFA) piling Refurbishment works within Caroline Chisholm and Clinical Services Building
Key Issues and Risks	Asbestos is commonly used as an acoustic insulator and can be found in brake pads (i.e., lifts), thermal insulation (i.e., pipes and cables), fire proofing (i.e., Steel beams) and in building materials such as ceiling tiles, wall panels, pipes, floor tiles, linoleum, and mastic. Asbestos is made up of microscopic bundles of fibres that may become airborne when distributed. These fibres may become inhaled into the lungs with significant potential risks to human health.

Other hazardous building products that may be encountered on site include fluorescent light fittings with capacitors containing PCBs and building materials coated with lead-based paints. These materials pose potential risks to the environment and human health if removed, handled and/or disposed of inappropriately.

The works required on site will involve the demolition of:

- Thomas & Rachel Moore education centre
- Alex Grimson building.
- Oncology building.
- Pathology building.

The works will require the disturbance, removal, handling, and disposal of building components that contain:

- Asbestos,
- Lead, \PCB's.

The activities expected to have the greatest potential to impact on the local environment, site workers and community are:

- Site clearing and establishment.
- Removal of building components.
- Demolition of structures.
- Excavation and the removal of redundant services.
- Temporary storage of materials.
- Loading of materials and transport.
- Waste disposal.

The impacts of these works may include:

- Direct exposure of workers and the community to hazardous materials.
- Dust migration off site affecting project neighbours.
- Runoff of sediment containing contaminants.
- Pollution or contamination of land, air, water on and/or off-site due to poor handling and/or storage.
- Inappropriate disposal of materials resulting in contamination or pollution.

The implementation of the control measures identified in the EHS Plan, OHHMP and Asbestos and Hazardous Building Material Management Sub Plan are intended to prevent or mitigate these impacts.

Legislation, Approvals and Guidelines	Federal/National: Model Code of Practice: How to Safely Remove Asbestos (Safe Work Australia April 16) AS 4964-2004: Method for the qualitative identification of asbestos in bulk samples NOHSC Publication: Guidance Note for the Assessment of Health Risks arising from the use of Hazardous Substances in the Workplace (1994) NOHSC Publication: Guidance Note on the Membrane Filter Method for Estimating Airborne Asbestos Fibres 2nd Edition [NOHSC:3003(2005) NOHSC Publication: Guidance Note on the Membrane Filter Method for the Estimation of Airborne Synthetic Mineral Fibres [NOHSC:3006 (1989) NOHSC Publication: List of Designated Hazardous Substances [NOHSC:10005 (1999)						
	Globally Harmonised System of Classification and Labelling of Chemicals (GHS)						
	State:						
	Work Health and Safety Act 2011						
	Work Health and Safety Regulation 2017						
	Dangerous Substances Act 2004						
	Work Health and Safety (How to Manage and Control Asbestos in the Workplace Code of Practice) 2014						
	Work Health and Safety (How to Safely Remove Asbestos Code of Practice) 2014

	GMR 4.10 Occupational Health Exposure						
	GMR 4.11 Public Health Exposure						
	GMR: 4.15 Uncontrolled Release of Stored Energy (non-electrical))						
	Lendlease Construction Workplace Delivery Code (WDC)						
	PRA Occupational Health and Hygiene Management Plan (OHHMP)						
Summary of Site Controls	Works must be planned and implemented in accordance with the Lendlease GMRs, the Project EHS Plan, this Sub Plan and the Lendlease Construction WDC. These documents detail Lendlease's approach and commitment to pro-active and responsible site management.						
	Site specific controls, monitoring, reporting and performance measurements have been identified in this Sub Plan to protect the environment, workers, and community. These include but are not limited to:						

- Conducting a Hazardous Materials Building Survey (if deemed necessary) prior to any demolition or disturbance commencing.
- Air monitoring to be in place
- Preparing an Asbestos and Hazardous Building Materials Environmental Management Diagram (EMD) prior to any site activities commencing including clearing and demolition.
- Compiling a Hazardous Building Materials Register to document the location and type of hazardous materials present (in ground or buildings).
- Erecting barricades, barriers, signage etc and applying hazard identification tags on structures; and
- Implementing the following unexpected find protocol if suspected toxic or hazardous materials are discovered/exposed during demolition/construction activities in an area of the site believed to be free of hazardous materials.

Asbestos and hazardous building material handling and disposal requirements must be included in relevant specifications, contract agreements, quality assurance documents, and subcontractor work method statements.

Site inspections, air monitoring and reporting will be undertaken by Lendlease, and subcontractors as detailed in the EHS Plan and the following implementation table.

Reference Documents

The following documents are to be references and a remediation action plan approved by a qualified hygienist be developed, prior to any works commencing on site:

- Hazardous Materials Survey Report and Register EMS196723 Hazmat Register Liverpool Hospital SWSLHD 09 05 2019
- Hazardous Building Material Survey for Proposed Building Works JKE E32674BTrpt HAZ Liverpool
- Stage 1 Environmental Site Assessment E32465BDrpt-Rev Liverpool
- Preliminary Environment Site Assessment E32465BDrpt3 Liverpool Final

Unexpected Find Protocol

- 1. Cease work and evacuate the area of work immediately.
- 2. Contact a LL representative (EHS Manager/Coordinator, General Foreman, Construction Manager).
- 3. Construction Manager to notify Principle
- 4. Erect barricades to isolate the immediate areas providing 10m between the suspect material and the erected barrier if possible.
- 5. Notify the appropriate regulatory authorities as soon as possible if applicable.
- 6. Prevent access to the barricaded area unless express permission has been given by the qualified environmental specialist. A clearance certificate or approval should be given in writing prior to entry.

Undertake sampling of the suspect material (to be carried out by an appropriately qualified environmental specialist, usually a consultant) as advised by the LL Construction Manager.
 Determine, in consultation with the nominated environmental specialist and in liaison with LL senior site personnel and/or relevant authorities, if further remedial actions are necessary based on the sample test results. Identify appropriate treatment/handling or disposal options and procedures.
 Obtain all required permits to carry out remedial work prior to the commencement of any new works. The nominated environmental specialist must provide written clearance approval for entry.
 Remove the barricade to allow work activities to resume under the direction of the LL Construction Manager.

2. IMPLEMENTATION OF THE SUB PLAN

Control Measure	Timing	Methodology	Responsibility	Monitoring and Reporting	Performance Measurement
Planning and Identification					
Undertake a Hazardous Building Material survey.	60 days prior to demolition works commencing	Survey be conducted by a qualified specialist consultant. Identify hazardous building materials	СМ	Survey prepared and reviewed. Register included. Findings incorporated into site documents.	All Hazardous Building Materials listed in Register. All Hazardous Building Materials tagged. Appropriate Safety Data Sheet present in file.
Prepare a Hazardous Building Material Register.	Prior to demolition works commencing	Establish a register based on survey. Communicate details to workers and subcontractors. Address in IHRA.	CM/SM	Details included in subcontractor WMS. Inspections prior, during and after material removal.	Register current.
Include information in the Site Induction about the risks and potential impacts of asbestos and hazardous building material handling.	Prior to works commencing and ongoing	Revise Lendlease standard induction package to include site specific information. Deliver induction material.	CM SM	WMS prepared by subcontractors to address environmental and safety requirements.	Site induction delivered to all workers on site.
Prepare an Asbestos and Hazardous Building Materials Environmental Management Diagram (EMD) showing the location of affected in structure, buildings, and site areas.	At site establishment and prior to works commencing	Review Environmental Management Diagram (EMD Appendix 1). Prepare diagram showing details of affected structures/ areas.	CM SM	EMD reviewed. Diagram prepared prior to works commencing.	Diagram prepared containing all relevant details and communicated to all relevant parties.

Control Measure	Timing	Methodology	Responsibility	Monitoring and Reporting	Performance Measurement	
					Diagram updated to reflect changes in site conditions.	
					Controls implemented in accordance with the EMD.	
Install barriers, fencing, tags, signage etc, around/on affected structures/areas as per the EMD.	Prior to works commencing	Undertake a site inspection to verify the correct location of controls. Install controls in accordance with EMD, design/engineers' documentation.	SM	Daily surveillance to assess effectiveness and condition. Weekly/monthly inspection	Controls modified or new controls installed as required.	
Develop health and environmental monitoring programs (as required). i.e., air monitoring	Prior to works commencing	Engage a specialist consultant to develop and advise on monitoring requirements.	СМ	Daily surveillance & reporting	Monitoring implemented as required.	
Identify handling, loading and temporary storage areas.	Prior to works commencing. Always maintain	Retain existing hard surfaces where possible. Establish secure storage areas with appropriate signage, dust, and runoff controls. Construct stable site entry/exit points and roadways using appropriate materials.	SM Foreman	Daily surveillance and maintenance. Weekly/monthly inspection	No tracking onto public roads or dust. Tracking of all waste materials removed from site. No runoff or loss of materials.	
Demolition/Refurbishment Works	Demolition/Refurbishment Works					

Control Measure	Timing	Methodology	Responsibility	Monitoring and Reporting	Performance Measurement
 Engage licenced contractors to undertake the removal of: Asbestos and related building materials. PCBs in light fittings. Timber/metal/brick structures containing lead-based paints or other hazardous substances. 	At all times	Include removal, handling and disposal procedures and controls in subcontractor SWMS. Implement monitoring program/s.	CM SM	Daily surveillance. Weekly/monthly inspection Clearance certificate from occupational hygienist.	SWMS requirements met. No asbestos dust particulates detected during monitoring. Appropriate PPE worn.
Maintain barriers, tags, signage, dust, and runoff controls in an operable condition, until works are completed and validated.	At all times and after rain events	Install new controls as new work areas open. Check the condition of controls. Undertake maintenance as required.	SM Foreman	Daily maintenance. Weekly/monthly inspection	No breach of environmental and/or safety requirements.
Excavation of Contaminated Material (mechanical me	eans)			
Engage a licensed contractor to undertake and supervise the works.	At all times	Provide removal procedures in contractor SWMS (i.e., sprays to stabilise paints /dust). Implement dust monitoring (as required).	SM Foreman	Daily inspections	WMS followed. No noncompliance detected by the asbestos licensed removal contractor.
 Ensure: Excavator (plant) has an enclosed cabin for the operator; and Operator remains inside the cab for the duration of works with air conditioning running. 	At all times	Document removal procedure documented in contractor SWMS (i.e., sprays to stabilise paints /dust). Implement dust monitoring (as required).	SM Foreman	Daily inspections	WMS followed.
Implement dust, erosion and sediment		Ensure a reliable source of water is	SM		

Control Measure	Timing	Methodology	Responsibility	Monitoring and Reporting	Performance Measurement
		Implement erosion and sediment controls to capture potentially contaminated sediment. Document removal procedures in contractor SWMS. Implement dust monitoring (as required).			
Prepare and implement specific procedures for the transport of excavated, asbestos impacted soil to approved locations.	At all times	Load asbestos impacted soil into a truck or bin lined with 200µm thick polythene. Truck/bin to be securely covered and sealed. Dispose of material in accordance with authority requirements. Keep dockets/tracking details.	SM Foreman	Daily inspections	SWMS followed. Waste tracking of trucks/bins leaving site and dockets from licensed landfill.
Excavation of Contaminated Material (non-mechanic	al means)			
Engage a licensed contractor to undertake and supervise the works.	At all times	Document removal procedures in contractor SWMS (i.e., sprays to stabilise paints /dust). Implement dust monitoring (as required).	SM Foreman	Daily inspections	SWMS followed. No non-compliance detected by the asbestos licensed removal contractor.
Establish defined 'contamination zones' where asbestos material is located on exposed or excavated surfaces.	At all times	Remove asbestos debris using a combination of 'emu picking' and raking and place material into a 200µm thick polythene bag until it is no more than 50% full. When at 50% capacity, the bag should be double bagged and sealed air-tight with industrial tape.	SM Foreman	Daily inspections	SWMS followed. No non-compliance detected by the asbestos licensed removal contractor.

Control Measure	Timing	Methodology	Responsibility	Monitoring and Reporting	Performance Measurement
Obtain a clearance certificate.	As required	Engage an occupational hygienist to inspect the surfaces of the excavated area including ground surfaces to confirm there is no visually identifiable asbestos remaining on site.	SM Occupation al hygienist	Inspections to all areas as required	Issue of a clearance certificate following a satisfactory inspection result.
Backfill excavations in asbestos impacted soils (including new service trenches) with certified clean fill.	At all times as required	Install a geo-textile fabric layer along the walls and base of the trench as well as over ground surfaces to provide delineation between the clean fill and asbestos impacted soils. Use certified clean fill such as crushed concrete or a pebble layer at the base of the trench for the new services to sit on. Use clean, validated fill material to backfill and encapsulate the trench. Engage the occupational hygienist to inspect surfaces of the backfilled trench including the ground surface, to confirm the encapsulation of the asbestos impacted soils with geo-fabric.	SM	Inspections to all areas as required	SWMS followed. Certified documentation for clean fill obtained.
Temporary Storage, Transport and Disposal					
Undertake sampling and analysis of the soil/material to determine its waste classification.	At all times	Engage a specialised environmental consultant to undertake sampling and provide a waste classification report. Identify a suitably licensed facility to accept the waste.	CM SM	Waste classification report.	Acceptance by licensed waste facility
Provide dedicated and clearly identified bins for the temporary on-site storage of asbestos, PCBs, lead-based paints, or	At all times	Provide dedicated and clearly marked/delineated waste bins. Bins must	SM	Daily inspections	Waste correctly stored in marked bins.

Control Measure	Timing	Methodology	Responsibility	Monitoring and Reporting	Performance Measurement
other hazardous building materials – where storage is required.		be lined and sealed prior to removal for disposal.			No cross contamination of wastes.
Track details for all materials excavated from the site and <u>transported</u> for disposal (i.e., cradle to grave).	At all times	 Document detailed and specific procedures for the transport and disposal of asbestos, PCBs, lead based paint and other hazardous materials. Identify suitable licensed waste transporters and facilities. Transport asbestos impacted fill and/or hazardous building materials off-site in leak proof, covered vehicles and dispose of at a licensed facility (based on waste classification). Record the following for trucks leaving site: Origin of material. Material type. Approximate volume; and Truck registration number. 	CM SM EHS	WMS prepared by subcontractor Daily inspections. Tracking register of trucks or bins leaving site. Periodic inspections of transport vehicles/containers. Periodic inspection of waste disposal documentation.	No non-conformances from inspections. All transport vehicles covered and showing appropriate signage and permits. No rejection of loads from licensed facility.
<u>Dispose</u> of all asbestos affected/ exposed materials to a licensed facility.	At all times	Bag, double wrap and seal bags of polythene, coveralls, geo-fabric, and rags used during the operation for disposal as asbestos contaminated waste. Transport affected/hazardous materials to an appropriately licensed waste facility.	SM	Tracking of materials and/or bins leaving site. Check license/approval of facility to receive waste.	No non-conformances from inspections. No rejection of loads from licensed facility. Landfill waste dockets correspond to removed waste volumes/types.
Environmental Monitoring (air) and Clo	earance				

Monitoring and Performance **Control Measure** Methodology Timing Responsibility Reporting Measurement Request that the OH carry out a full visual inspection of the work area prior to the commencement of asbestos/ hazardous materials removal works to ensure containment measures are satisfactory. Prior to work Daily inspection and Request that the OH carry out perimeter, commencina. Monitoring results. checks during works to personal (including excavator operator) check monitoring and clearance air monitoring* and Certificates and Ongoing – as equipment and identify CM Engage an occupational hygienist (OH) inspections. determined by inspection reports dust. to implement monitoring and undertake SM (*continuous asbestos fibre monitoring must be the OH provided by OH. inspections of the work. conducted by a NATA accredited OH) OH Request that the OH carry out a full Continuous fibre At completion Satisfactory clearance inspection of the work area and transit monitoring. of removal inspection. route at the completion of hazardous work material removal works. If removal works are not to the satisfaction of the OH, removal contractors will be required to re-enter the work area to rectify any issues arising from the inspection. **Personal and Plant Decontamination** Ensure personal decontamination occurs each time workers leave an asbestos affected work area AND at the completion As detailed in the WMS of the asbestos removal work. Establish a process and personnel prepared by subdecontamination facilities within the When leaving the work area all site contractor. Hygienist inspection asbestos affected area in a location At all times SM personnel must make their way to the reports and clearance. where re-contamination cannot occur. Daily inspections of nominated decontamination area, remove decontamination area. their coveralls, and clean their masks and process, and controls. boots using the wet rags. Respirator must remain on during decontamination and must only be

Control Measure	Timing	Methodology	Responsibility	Monitoring and Reporting	Performance Measurement
		removed on completion of decontamination. All equipment and waste removed from the asbestos affected work area must be decontaminated using wet rags. At the completion of works, all asbestos related materials including polythene, coveralls, geo-fabric, and rags must be double wrapped and sealed for disposal as asbestos contaminated waste.			
Establish a process and an area for the decontamination of <u>plant</u> used in the removal of asbestos or other hazardous materials.	At competition of works or if plant moved within or off site.	Park excavators/trucks etc within a designated washing area at the conclusion of works. Remove all soil from the tracks, body, and bucket as far as reasonably practicable. Collect, remove, and deposit soil and sediment from the cleaning process in a truck parked outside of the asbestos affected area. Classify and dispose of waste (including soil/sediment) in accordance with relevant State Government requirements.	SM	As detailed in the WMS prepared by sub- contractor. Daily inspections of the decontamination area, process, and controls.	Landfill waste dockets provided. Landfill dockets match waste volumes/types removed.
